《Global Challenges in Engineering》

This unit lies at the start of the pathway to becoming an engineer. There are many personal and professional skills and knowledge which need to be gained in order to make use of the technical knowledge. In the unit, students are able to demonstrate a deeper understanding of the environmental, social and economic context in which engineering is practised, and enhanced creative thinking and appreciate the barriers to creative thought.

《Communicating Science》

What is scientific knowledge, how does it develop and how can it be more effectively communicated?
How do you determine credibility of 'scientific' information and decide what information to use and how to use it appropriately?

Students find, examine and critically analyse information relating to a scientific topic. They learn to discuss their findings, write a scientific article and give an oral presentation. In this unit, students are able to have an awareness and understanding of scientific practices, including the scientific method, development of scientific knowledge and communication about that knowledge to others.

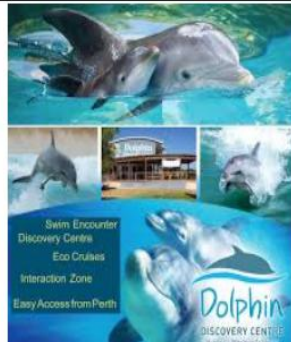

《Problem Solving and Programming》

Problem solving is a key intellectual activity. Computer technology has become an important tool to help solve problems in a wide range of disciplines, from the natural sciences, engineering and mathematics to business, architecture, the social sciences and medicine. While effective programs are available for many kinds of tasks, each program can only perform the tasks anticipated when it was designed. Thus to fully utilise the potential of computer technology, it is necessary to build programs that are specifically designed to solve a particular problem. Students taking this unit learn to solve problems via programming, with a focus on building small programs for specialised tasks.

《Environmental Science and Technology》

The unit content is delivered through modules related to: climate change and carbon pollution; catchment development and water resource management; biodiversity loss and conservation; land degradation; coastal systems; and cities. Through these lenses, the unit looks to explain lessons to ensure students establish the connection between environmental processes and the manifestation of environmental degradation and recovery.
